Insurance: United Healthcare Choice Plus | Member ID: UHC3PS00194

Re: Preventive medication trial clarification - Botox PA support

Date of Addendum: May 5, 2026

PURPOSE OF THIS ADDENDUM

This addendum supplements the neurology progress note dated May 5, 2026 to clarify the preventive therapy trial history for Ms. Priya Shah and to confirm that the two-class failure criterion for onabotulinumtoxinA (Botox) prior authorization is satisfied.

PREVENTIVE MEDICATION TRIAL HISTORY

1. Propranolol 80 mg daily (Beta Blocker class)

Initiated: September 2025 | Discontinued: January 2026 | Trial duration: 4 MONTHS

Reason for discontinuation: Symptomatic hypotension (BP documented 90/58 consistently) and worsening migraine frequency despite adequate therapeutic dose and duration.

Status: DOCUMENTED FAILURE - Adverse effects + lack of efficacy after 4-month trial

This trial SATISFIES the ≥ 2 -month adequate trial threshold for the beta blocker class.

2. Topiramate 100 mg daily (Antiepileptic class)

Initiated: November 2025 | Discontinued: February 2026 | Trial duration: 3 MONTHS

Reason for discontinuation: Intolerable cognitive adverse effects - word-finding difficulties, memory impairment, and concentration difficulties interfering with professional function.

Status: DOCUMENTED FAILURE - Intolerable adverse effects after 3-month trial

This trial SATISFIES the ≥ 2 -month adequate trial threshold for the antiepileptic class.

3. Amitriptyline 25 mg nightly (Tricyclic antidepressant class)

Initiated: March 2026 | Discontinued: April 2026 | Trial duration: 6 WEEKS

Reason for discontinuation: Moderate sedation impairing professional function.

Note: Duration is 6 weeks, below the 2-month recommended threshold.

Clinical note: This trial is NOT required to satisfy criterion 2 - see summary below.

CRITERION 2 DETERMINATION

The payer criterion requires failure of preventive therapy from at least 2 of 3 specified therapeutic classes (beta blocker, antiepileptic, tricyclic antidepressant), with each failed trial meeting the ≥ 2 month adequate trial duration threshold.

CRITERION IS SATISFIED by trials #1 and #2:

* **Propranolol (beta blocker): 4-month trial - EXCEEDS 2-month minimum threshold**

* **Topiramate (antiepileptic): 3-month trial - EXCEEDS 2-month minimum threshold**

The abbreviated amitriptyline trial (6 weeks, trial #3) is documented for transparency and completeness. It represents an additional attempt at a third preventive class. Its 6-week duration below the 2-month threshold does NOT affect criterion satisfaction since two qualifying class failures are already established by trials #1 and #2.
