

PHYSICAL THERAPY DISCHARGE SUMMARY

Valley Physical Therapy & Rehabilitation Center | License: CA-PT-88721

Patient: Sam Rodriguez | DOB: 09/04/1972 | Sex: M | MRN: EHR-SR-001

Insurance: United Healthcare Choice Plus | Member ID: UHC9SR00287

Referring Physician: Dr. James Patel, MD - Orthopedic Surgery

Primary Therapist: Rachel Kim, DPT | Valley PT & Rehabilitation Center

Diagnosis: Internal derangement, right knee (ICD-10: M23.231)

Treatment Period: March 10, 2026 through May 3, 2026 (8 weeks)

Treatment Frequency: 2 sessions per week | 16 sessions total

PRESENTING COMPLAINT

Mr. Sam Rodriguez presented with right knee pain rated 7/10 at rest and 9/10 with activity, following a twisting injury during recreational soccer approximately 5 months prior. He reported medial joint line pain, intermittent swelling, and mechanical symptoms (clicking, catching). Significant functional limitation with stairs, squatting, and prolonged walking.

Initial measurements: Pain 7/10 rest / 9/10 activity | ROM: Flexion 0-110 deg (pain-limited)
Quad strength 3+/5 | Single-leg stance: 8 seconds | KOOS Score: 31/100

TREATMENT PROVIDED (8 WEEKS, 2X/WEEK)

Weeks 1-2: Pain management and ROM restoration

- * Therapeutic modalities: ice, electrical stimulation for pain and edema control
- * Passive ROM exercises, straight leg raises (isometric quad strengthening)
- * Gait training with partial weight-bearing as tolerated

Weeks 3-4: Progressive strengthening - closed chain

- * Stationary bike (low resistance), wall slides (0-45 deg), terminal knee extensions
- * Standing calf raises, hip abductor strengthening
- * Activity modification reinforced: no running, pivoting, or soccer

Weeks 5-6: Functional strengthening and proprioception

- * Mini-squats progressing 0-60 degrees, step-ups and step-downs (4 to 8 inch)
- * Single-leg balance progression, lateral band walks, balance board training

Weeks 7-8: Sport-specific exercises and discharge planning

- * Progressive squatting to 90 degrees, lateral shuffles, controlled pivoting
- * Home exercise program instruction, functional assessment completed

NSAID therapy: Naproxen 500 mg BID throughout the 8-week course per physician order.

Patient reported partial pain relief but persistent mechanical symptoms throughout.

OBJECTIVE FINDINGS AT DISCHARGE (MAY 3, 2026)

Pain: 5/10 at rest, 7/10 with stairs / squatting (was: 7/10 rest, 9/10 activity)

ROM: Flexion 0-130 deg (was: 0-110 deg at initial evaluation)

Strength: Quadriceps 4+/5, hamstrings 4+/5 (was: 3+/5 bilaterally)

Single-leg stance: 20 seconds right (was: 8 seconds at initial evaluation)

KOOS Score: 48/100 (was: 31/100 - MCID of 10 reached; functional recovery incomplete)

Functional status: Unable to return to recreational soccer or sustained stair activity without pain

CLINICAL RECOMMENDATION

After completion of a structured 8-week physical therapy program (16 sessions, 2x/week) combined with NSAID therapy (naproxen 500 mg BID) and activity modification (no running, pivoting, or recreational soccer), Mr. Rodriguez demonstrates limited functional improvement. Pain remains significant at 5/10 at rest and 7/10 with functional activities. KOOS score of 48/100 at discharge represents incomplete recovery and ongoing functional impairment.

Based on documented failure of conservative therapy across all three required modalities -- formal physical therapy (8 weeks / 16 sessions), NSAID therapy, and activity modification --

this therapist recommends that Mr. Rodriguez is an appropriate candidate for further orthopedic workup including MRI imaging to guide clinical decision-making regarding potential surgical intervention. Conservative therapy has been maximized at this time.
